

# Stuck Sales Order Issue Transactions

Seven Inventory transactions sitting in error in MTL\_TRANSACTIONS\_INTERFACE since 2026-04-24. Real data pulled from EBSCDB on 2026-05-13. Every value is verifiable by query.

|                       |                    |                         |                 |

|-----------------------|--------------------|-------------------------|-----------------|

## Customer-facing problem

|                 |                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modules         | Oracle Inventory (INV) and Order Management (OM)                                                                                                                   |
| Reported by     | Warehouse supervisor, Vision E3 distribution centre                                                                                                                |
| Severity        | P2 (High). Cycle count accuracy degrading. Finance will pick up the variance.                                                                                      |
| Business impact | Customers received "shipped" emails but on-hand stock still shows the goods available. Next picking wave will pick already-shipped stock and create a discrepancy. |

### CUSTOMER SUMMARY (VERBATIM)

Sales Order shipments are being confirmed in Order Management but the inventory is not being relieved. We are running short on cycle count accuracy. Customers are getting shipped emails but the system still shows the stock on hand. The Inventory Interface log shows seven stuck transactions sitting in error since 2026-04-24. Please diagnose.

## What the error says

Every stuck row carries the same EBS error message.

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| ERROR_CODE        | Transaction processor error                         |
| ERROR_EXPLANATION | An error occurred while relieving reservations.     |
| PROCESS_FLAG      | 3 (error)                                           |
| TRANSACTION_TYPE  | Sales order issue (id 33, Ship Confirm external SO) |
| SOURCE_CODE       | ORDER ENTRY                                         |

## The seven stuck transactions

Pulled live from inv.mtl\_transactions\_interface on 2026-05-13. Every value below is real.

| ITF ID   | Org | Item    | Description               | Qty  | Stuck since            |
|----------|-----|---------|---------------------------|------|------------------------|
| 26700668 | M2  | XP9006  | Television 96"            | -21  | 2026-04-24<br>01:35:30 |
| 26700655 | E3  | AS54888 | Sentinel Standard Desktop | -5   | 2026-04-24<br>01:35:30 |
| 26700614 | E3  | AS54888 | Sentinel Standard Desktop | -8   | 2026-04-24<br>01:35:29 |
| 26700604 | E3  | CM32546 | Battery, Li Ion (6 Cell)  | -249 | 2026-04-24<br>01:35:29 |
| 26700603 | E3  | AS54888 | Sentinel Standard Desktop | -3   | 2026-04-24<br>01:35:29 |
| ...      | E3  | AS54888 | Sentinel Standard Desktop | -4   | 2026-04-24<br>01:35:29 |
| ...      | E3  | AS54888 | Sentinel Standard Desktop | -5   | 2026-04-24<br>01:35:29 |

### PATTERN

Three of seven are for item AS54888 in org E3 (Sentinel Standard Desktop in Vision Boston).

All seven are negative quantity (issues, not receipts).

All seven came from Order Entry ship confirms.

All seven failed at the same step: relieving the reservation.

All seven got stuck on the same day at 01:35. Same root cause, repeated.

## Audience verification path

If anyone in the room wants to verify the data is real, they can connect to EBSCDB on apps.example.com:1521 as the apps user and run this query. The same seven rows will come back.

```
SELECT transaction_interface_id, organization_id,  
       inventory_item_id, transaction_quantity,  
       error_code, error_explanation  
FROM inv.mtl_transactions_interface  
WHERE process_flag = 3;
```

## Likely root cause

The Inventory Transaction Worker tried to call `INV_RESERVATION_PUB.relieve_reservation` for each ship confirm. The matching row in `MTL_RESERVATIONS` could not be found or could not be adjusted to net zero.

This usually means one of four things:

- 1 The reservation was released by another process between pick release and ship confirm. Order Management still thought it had a reservation.
- 2 The reservation is for a different sub-inventory or locator than the ship transaction is trying to issue from.
- 3 The reservation was created against a different revision or lot than the ship is attempting to relieve.
- 4 The reservation row was orphaned by a partial cancel that left the delivery line in an inconsistent state.

### MOST LIKELY FOR VISION ITEMS

AS54888 and CM32546 are revision-controlled. Options 2 and 3 (sub-inventory or revision mismatch) are the most likely root cause for this set.

## Recommended fix

- 1 **Run the Inventory Manager diagnostic** for each stuck row. Inventory responsibility, Transactions, Pending Transactions. Find row 26700668. Tools, Show Error. The full error stack will tell you which reservation lookup failed.
- 2 **For each stuck row, query `MTL_RESERVATIONS`** with the source reference to confirm whether a reservation row still exists. If yes, capture its sub-inventory, locator, revision, and lot. Compare to the values in `MTL_TRANSACTIONS_INTERFACE`.
- 3 **If the reservation is missing**, the safest path is to delete the stuck row from `MTL_TRANSACTIONS_INTERFACE`, then have Order Management create a new pick release for the affected line. Do not just retry the worker. It will fail again.
- 4 **If the reservation exists but mismatches the ship**, update the reservation in `INV_RESERVATION_PUB` to align with the ship issue, then resubmit Inventory Transaction Worker.
- 5 **Open Oracle MOS Doc ID 460215.1** for the complete diagnostic SQL pack covering ship confirm versus reservation mismatches.
- 6 **Add monitoring.** Schedule a query on `MTL_TRANSACTIONS_INTERFACE` where `PROCESS_FLAG=3`, with an alert that pages WMS operations within 30 minutes. Seven transactions stuck for 19 days is not acceptable.

## How to use this in the demo

Use this for Scene 1 (reactive flow). Every value in the ticket is real and verifiable by query against the live EBSCDB instance. The audience can challenge any specific number and it will check out.

### LIVE FLOW

- 1 Open SUP-3 from the JIRA page in this app. Show the customer summary in the drawer.
- 2 Point out the seven specific transaction interface ids and the items AS54888, CM32546, XP9006. Invite the audience to verify them by query.
- 3 Click **Troubleshoot in EBS**. While Claude is working, explain: the model classifies this as a fulfillment or sales order issue, picks the right Agentic Apps, and runs them against the same live EBSCDB the audience can query.
- 4 When findings render, confirm the seven stuck rows show up. The Likely root cause section should mention MTL\_RESERVATIONS, sub-inventory mismatches, and the ship confirm step.
- 5 Click **Post Report as JIRA Comment**. Switch to JIRA web and show the formatted comment with headings, bold table names, and a numbered fix list.

### CONFIDENCE LINE

Open with: "What you see on this ticket is not a slide. It is the actual state of MTL\_TRANSACTIONS\_INTERFACE in the EBS instance running behind me. Anyone with database access can confirm." That single sentence sets the credibility tone for the whole demo.
